Knudsen SafeCaps

Knudsen SafeCaps

- increases safety on the construction site

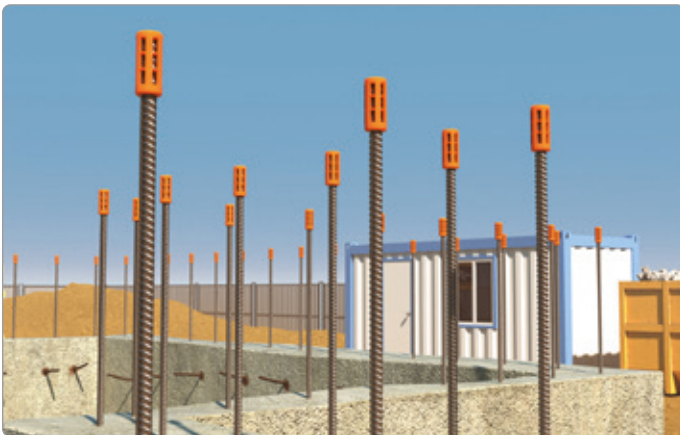

- Reduces the risk of tearing and fall damage
- Patented barbs hold the SafeCaps in place
- Delivered in bags and can be retained outside
- Suitable for steel with diameter 6-16 mm
- Resistant to all kinds of weather
- Not affected by damp, rot, or dry rot

Knudsen SafeCaps are small safety caps, which have been specially developed with a focus on safety and functionality to minimize the risk of work-related injuries.

They offer extra protection by covering dangerous and sharp ends of e.g. rebar and threaded rods. This reduces the risk of accidental lacerations and minor fall injuries and ensures a safer work process.

The safety caps are easy to use and require no special expertise. They can be easily put on, already from the element factory or directly on the construction site, and removed again, which makes it practical to implement safety measures in daily work AND also to comply with the Danish Working Environment Authority's safety requirements in this area.

Knudsen SafeCaps are made from a durable, high-quality material that ensures long-lasting protection.

The patented barbs are designed to withstand the challenges of the workplace and remain effective under various working conditions, as well as retaining the SafeCaps in high winds or during transport.
